Texas Supreme Court upholds "rule of capture" ground water law

Area underground water conservation district managers are praising the Texas Supreme Court's unanimous May 6 decision to uphold the state's 95-year-old "rule of capture" law for ground water use. While they are pleased with the decision, they remain cautious about the Court's ruling, which leaves open the possibility of future changes in ground water law if the water law reform contained in Senate Bill 1 does not achieve its desired effect.

"We are pleased that the Supreme Court ruling recognized that the people of Texas have voted to place the responsibility for ground water regulation in the hands of the state legislature," said A. Wayne Wyatt, manager of the High Plains Underground Water Conservation District No. 1 in Lubbock. "The justices chose to allow time for the provisions of Senate Bill 1 to work."

He added that a future ruling by the court will almost certainly have a different outcome if Texas ground water conservation districts fail to provide for the conservation, preservation, protection, recharging, and prevention of waste of ground water."

In the original lawsuit, Henderson County landowners Bart Spiriano, Harold Fain, and Doris Fain (Spiriano) sued Great Spring Waters of America (Ozarka) for negligently draining their water wells. According to Spiriano's allegations, Ozarka began pumping 90,000 gallons/yr. ground water per day, seven days a week, from land near Spiriano's. The suit alleged that Spiriano's wells were severely depleted as soon as pumping began.

Ozarka asserted that drought conditions and local water use–not the company–lowered the ground water levels of the Carrizo Aquifer. Ozarka's defense was the supremacy of the state's "rule of capture" ground water law. The law, first stated in 1904 by the Texas Supreme Court, states that a landowner may pump as much ground water as desired from their tract(s) of land.

The District Court in Henderson County issued a summary judgement in December 1996, saying that the "rule of capture" barred the local landowners' claim. The landowners appealed, but the Court of Appeals for the Twelfth District of Texas affirmed the lower court's decision in 1998.

The plaintiffs asked the Texas Supreme Court to change Texas ground water law from the "rule of capture" to a "reasonable use rule," such as has been adopted in Ohio.

An amici curiae brief filed by six underground water conservation districts in the Texas High Plains contended that such a change in the 95-year-old Texas water law was not necessary. The amici curiae brief by attorney Gary R. McLaren of McWhorter, Cobb, and Johnson LLP describes the Texas Legislature's efforts to incorporate concerns for reasonable ground water use into the "rule of capture" through the creation of underground water conservation districts, which are empowered to reduce well interference, increase conservation of reasonable and beneficial water use, conserve aquifers, and protect ground water ownership rights.

Justice Craig Enoch, writing for the court, said the case presents "compelling reasons for ground water use to be regulated," but that a sweeping change from the "rule of capture" law to a "reasonable use rule" would be inappropriate just two years after the passage of Senate Bill 1 by the 75th Texas Legislature in 1997. Senate Bill 1 declares local ground water districts to be the preferred method of managing ground water in Texas.

"It would be improper for courts to intercede at this time by changing the common-law framework within which the Legislature has attempted to craft regulations to meet this state's ground water conservation needs...It is more prudent to wait and see if Senate Bill 1 will have its desired effect, and to save for another day the determination of whether further revising the common law is an appropriate preoccupation of this Court with natural resources and protect property owners' interests," wrote Justice Enoch.

The ground water conservation districts in the Texas High Plains region include the High Plains Underground Water District at Lubbock, the North Plains Underground Water Conservation District at Dumas, the Panhandle Groundwater Conservation District at White Deer, the Sandy Land Underground Water Conservation District at Plains, the Mesa Underground Water Conservation District at Lamesa, and the South Plains Underground Water Conservation District at Brownfield.

Dry conditions may force producers to "retool" their farm strategies

Most cotton producers on the Texas Plains saw their crop management strategies lead to naught last year, due to the withering drought.

If dry conditions persist this year, producers should think about "retooling" their strategies, two agronomists and an irrigation specialist told farmers at a March crops conference in Lubbock.

"I wouldn't be too pessimistic about the chances for a repeat of last year's drought...not yet anyway," said Dr. Dan Krieg, Texas A&M farmer and a Texas Tech University professor of plant and soil science. "We didn't receive much winter rainfall, but we normally average less than 5 inches of rainfall from November through April in the Lubbock area.

"What we count on is getting up to 13 inches of rain between May and October, right during the cotton growing season. But even in the best rainfall years, keep in mind that our evaporation potential is four times greater than our normal average rainfall."

Krieg said producers should water their crop wisely and do all they can to preserve the moisture stored in the soil.

"Cotton reaches its peak water demand 90 to 100 days into the growing season, when the crop is in peak bloom," he added. "With average rainfall and a well capable of pumping 3 gallons per minute per acre, we can meet that water requirement.

"But there is no benefit in watering beyond peak bloom. In fact, research on the South Plains has shown that watering after peak bloom, when the first bolls begin to open, actually lowers the crop's yield potential."

Retrofitting center pivot sprinklers to maximize irrigation efficiency and increase a crop's water use efficiency also aids crop survival during dry years, said Dr. Leon New, a Texas A&M professor of ag engineering and Extension irrigation specialist based in Amarillo. "If you haven't yet adopted Low Energy Precision Application (LEPA) technology on your pivots, I encourage you to do so.

"A LEPA pivot equipped with drag socks on its drop lines, running in a field with furrow dikes, achieves 95 to 98 percent irrigation efficiency. In other words, it loses only 2 to 5 percent of the water pumped to evaporation. It's the most efficient system we have."

LEPA systems equipped with bubble-mode nozzles are second in irrigation efficiency, followed by LEPA systems equipped with spray-mode nozzles, he said.

LEPA Conversion and Management, a Texas Agricultural Extension Service publication (B-1691) written by Drs. New and Guy Fipps, explains how to convert center pivots for LEPA. It is available on the Internet (http://aggiebookstore.tamu.edu/pubs/energie/b1691.pdf) or through county Extension offices.

"Skip-row watering (irrigating every other row) is another good water management strategy.

"And if you are concerned about watering the crop uniformly, I recommend installing pressure regulators and pressure gauges on a pivot's drop lines," New said. "Pay close attention to the pivot's nozzles, too. You may get better results simply by re-nozzling one or two drops, or an entire pivot."

Re-evaluating all crop inputs is another way producers can stay competitive and survive another dry crop year, said Dr. Randy Boman, cotton agronomist with the Texas Agricultural Extension Service in Lubbock.

Dry conditions may force
